<string name="large_text">
    "Material is the metaphor.\n\n"

    "A material metaphor is the unifying theory of a rationalized space and a system of motion."
    "The material is grounded in tactile reality, inspired by the study of paper and ink, yet "
    "technologically advanced and open to imagination and magic.\n"
    "Surfaces and edges of the material provide visual cues that are grounded in reality. The "
    "use of familiar tactile attributes helps users quickly understand affordances. Yet the "
    "flexibility of the material creates new affordances that supercede those in the physical "
    "world, without breaking the rules of physics.\n"
    "The fundamentals of light, surface, and movement are key to conveying how objects move, "
    "interact, and exist in space and in relation to each other. Realistic lighting shows "
    "seams, divides space, and indicates moving parts.\n\n"

    "Bold, graphic, intentional.\n\n"

    "The foundational elements of print based design typography, grids, space, scale, color, "
    "and use of imagery guide visual treatments. These elements do far more than please the "
    "eye. They create hierarchy, meaning, and focus. Deliberate color choices, edge to edge "
    "imagery, large scale typography, and intentional white space create a bold and graphic "
    "interface that immerse the user in the experience.\n"
    "An emphasis on user actions makes core functionality immediately apparent and provides "
    "waypoints for the user.\n\n"

    "Motion provides meaning.\n\n"

    "Motion respects and reinforces the user as the prime mover. Primary user actions are "
    "inflection points that initiate motion, transforming the whole design.\n"
    "All action takes place in a single environment. Objects are presented to the user without "
    "breaking the continuity of experience even as they transform and reorganize.\n"
    "Motion is meaningful and appropriate, serving to focus attention and maintain continuity. "
    "Feedback is subtle yet clear. Transitions are efficient yet coherent.\n\n"

    "3D world.\n\n"

```

"The material environment is a 3D space, which means all objects have x, y, and z " dimensions. The z-axis is perpendicularly aligned to the plane of the display, with the " positive z-axis extending towards the viewer. Every sheet of material occupies a single " position along the z-axis and has a standard 1dp thickness.\n" "On the web, the z-axis is used for layering and not for perspective. The 3D world is " emulated by manipulating the y-axis.\n\n"

"Light and shadow.\n\n"

"Within the material environment, virtual lights illuminate the scene. Key lights create " directional shadows, while ambient light creates soft shadows from all angles.\n" "Shadows in the material environment are cast by these two light sources. In Android " development, shadows occur when light sources are blocked by sheets of material at " various positions along the z-axis. On the web, shadows are depicted by manipulating the " y-axis only. The following example shows the card with a height of 6dp.\n\n"

"Resting elevation.\n\n"

"All material objects, regardless of size, have a resting elevation, or default elevation " that does not change. If an object changes elevation, it should return to its resting " elevation as soon as possible.\n\n"

"Component elevations.\n\n"

"The resting elevation for a component type is consistent across apps (e.g., FAB elevation " does not vary from 6dp in one app to 16dp in another app).\n" "Components may have different resting elevations across platforms, depending on the depth " of the environment (e.g., TV has a greater depth than mobile or desktop).\n\n"

"Responsive elevation and dynamic elevation offsets.\n\n"

"Some component types have responsive elevation, meaning they change elevation in response " to user input (e.g., normal, focused, and pressed) or system events. These elevation " changes are consistently implemented using dynamic elevation offsets.\n" "Dynamic elevation offsets are the goal elevation that a component moves towards, relative " to the component's resting state. They ensure that elevation changes are consistent " across actions and component types. For example, all components that lift on press have " the same elevation change relative to their resting elevation.\n" "Once the input event is completed or cancelled, the component will return to its resting " elevation.\n\n"

"Avoiding elevation interference.\n\n"

"Components with responsive elevations may encounter other components as they move between " their resting elevations and dynamic elevation offsets. Because material cannot pass " through other material, components avoid interfering with one another any number of ways, " whether on a per component basis or using the entire app layout.\n" "On a component level, components can move or be removed before they cause interference. " For example, a floating action button (FAB) can disappear or move off screen before a " user picks up a card, or it can move if a snackbar appears.\n" "On the layout level, design your app layout to minimize opportunities for interference. " For example, position the FAB to one side of stream of a cards so the FAB won't interfere " when a user tries to pick up one of cards.\n\n"
